

| Intrusion

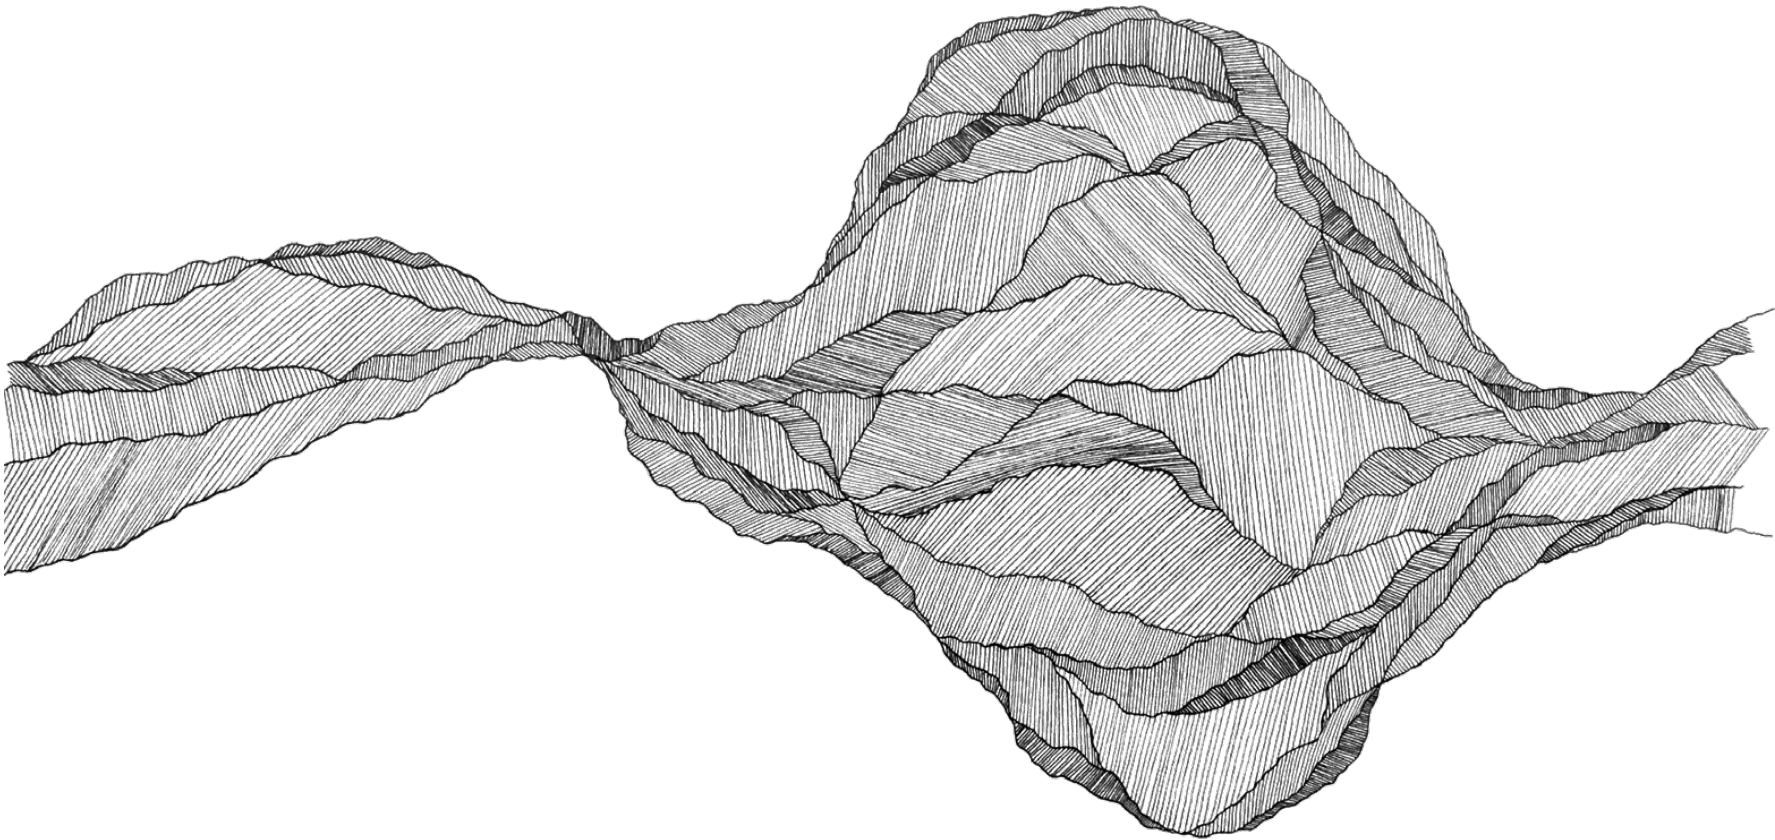

Figure 1.6. Hand drawings (pen and paper).

These hand drawings were inspired by a visit to Cape Surville on the Forestier Peninsula in Tasmania. The area around Cape Surville exhibits some very rare geological properties. One of the key features is the cliff visible on Deep Glen Bluff. The cliff presents the intrusion of Jurassic dolerite into Permian granite and Triassic limestone rocks, encapsulating three geological periods spanning over one hundred million years. The three different shades in these drawings represent these three main rock types, and the layered faces are reminiscent of the coloured bands of the cliff at Deep Glen Bluff.
